CONSTRUCTION UPDATE

NEWSLETTER | FEBRUARY 2021

WITH CONSTRUCTION moving ahead at a rapid pace, our new Clinical Services Building (CSB) is starting to take shape.

The 12-storey CSB is being built by CPB Contractors, and in addition to boasting world class health facilities and amenities, the facility will feature retail spaces, a community hub and a new helipad on the roof.

On completion of the new building in 2022, Campbelltown Hospital will be equipped to provide specialised mental health services, with six dedicated wards and a purpose-built space within the Emergency Department.

Modern paediatric and maternity wards have been designed, as well as specific aged care services embedded within the Emergency Department and Mental Health Unit to provide individual patient care plans for this growing community group.

Work is due to commence on the Hospital Street link bridges in coming weeks, which will connect the existing facility with the new CSB.

FUN FACT:

More than 3030 doors will be installed within the new Clinical Services Building, including 2020 single doors and 1010 double doors!

Enabling works to construct the new Hospital Street

A peek inside our new CSB!

L-R: Patrick Collins (Health Infrastructure Project Director), Julia Underwood (Redevelopment Project Director) and Ben Folkard (Taylor Construction General Manager) marked commencement of works

A new package of work has begun on site, which incorporates an expansion of the hospital's Clinical Information Department in Building D.

These works will also include refurbishment of the outpatient pathology laboratories and a new, fully-serviced dental and oral health unit – a first for Campbelltown Hospital.

The works are being carried out by Taylor Construction Group Pty Ltd, who joined the project late last year.

THE NEWLY expanded Macarthur Cancer Therapy Centre (MCTC) is nearing construction completion, with building works expected to wrap up in coming weeks.

The new \$15 million space will feature an additional Linear Accelerator (LINAC), which is a machine designed to administer radiation therapy to cancer patients. The new machine features targeted laser technology.

The extension expands the MCTC footprint substantially, with the space also featuring an Orthovolt to support diagnostic radiography and the treatment of skin cancers.

The extension includes additional inpatient bed bays, a single inpatient room, and increased administrative space which provides three new multipurpose meeting rooms, a control room and dedicated waiting areas for patients.

The LINAC bunker structure alone required more than 100 tonnes of steel reinforcement, and more than 520 cubic metres of concrete to contain the radiation.

The new LINAC being assembled in the MCTC extension
